

  
Personal  
Protective  
Clothing

During your time in Hospital the healthcare staff may need to wear gloves, apron / gowns and masks when providing care for you.

After contact with you they will be required to remove and dispose of the items and clean their hands.

### How can I contact a member of the Infection Prevention & Control Team?

Tell the Clinical Nurse Manager, doctor or nurse looking after you if you would like to speak to a member of the Infection Prevention and Control Team and they will contact us.

We have made every possible effort to make sure that all the information provided in this leaflet is true, accurate, complete and up to date at the time of publication

## (Infection Prevention & Control team)

## The Infection Prevention & Control Team (IPC Team)

The role of the Infection Prevention & Control Team is to promote best infection control practice. This ensures the delivery of a quality service for patients, visitors and staff.

### The Team do this by:

- Providing advice on management of patients with infections
- Educating healthcare workers regarding potential risks of infection
- Providing, monitoring and reviewing policies and information leaflets for the prevention and control of infection
- Auditing infection control practices throughout the Hospital
- Communicating and providing information on infection control to the healthcare workers
- Liaising with key stakeholders e.g. Hygiene Services, Technical Services, Bed Management and Catering regarding Infection Control standards

### Is there a risk of catching an infection while in hospital?

Everyone one carries germs on their body e.g. on the skin or in the gut. When these germs spread to other parts of the body they can cause infection. Some patients may have an infectious disease that can be easily spread from person to person. Many of these germs and diseases are already present in the community.

People vary in their ability to fight infection. If a person is elderly or has had surgery or has a poor immune system, poor general health or poor appetite, they are more likely to pick up an infection.

Germs spread through direct contact with skin or body fluids (for example dirty hands) or indirectly through contact with equipment or environment (for example equipment not cleaned between patients).

### The importance of clean hands

Keeping hands clean is one of the key ways to control the spread of infection in hospitals. Patients and visitors should wash their hands or use the alcohol gels provided.

**All healthcare staff should clean their hands before and after contact with patients.**

## Isolation

If you have an infection you may need to be moved into a single room for isolation to limit infection spreading from person to person or for your own protection.

Depending on your infection a coloured sign will be placed on your door that tells staff to use the necessary precautions. This sign does not give details of your infection. Visitors must check with your nurse before visiting.

### Who are the IPC Team?

The Team includes:

- Consultant Microbiologists
- Infection Prevention & Control Nurses
- Surveillance Scientists
- Antimicrobial Pharmacists

**Remember it only takes 30 seconds to clean your hands!**
